Game concepts, mechanics, you wish were explored more. #1

I recently made a thread about I was befuddled no one has made an open world RTS. That got me thinking about concepts you see in games, but you wish you saw more of. Now folk have their respective feelings about cover systems and regenerating health. Those sorts of things have been all the rage this generation. What are the things you would like to see explored more next generation, that perhaps, have been forgotten for a generation or two? I'll elaborate with some examples.

Real Time Strategy with Direct Control.

Now, you might say, NT122, get the fuck outta here, you point and you click, you're directly controlling your soldiers. This ain't *Majesty*, this ain't *Black and White*

and I say to you, *this* is what I'm talking about

I want more fully featured Real time tactics games where I control my favorite soldier or hero unit and wreck house. It's not always e-sports balanced, but I think it's damn fun. I want to see more games with this mechanic.

Anything you'd like to see in the next few years GAF?

More realistic flight mechanics or at least the feel of flight and lift in parts of games. Even in a dumbed down way such as PilotWings 64.

This interests me as well. Has ARMA III mentioned anything about it?

The only thing I can find is this quote by a dev that says the Take on Helicopters flight model will be in ARMA 3.

"Take On helicopter flighmodel WILL BE also in Arma3. Now I can safely confirm it will be also in campaing and it will be DEFAULT flightmodel for ALL the helicopters."

This [thread](#) has a lot in it, but I'm not sure how that applies to anything other than helicopters, lol.

Honestly I don't follow the game much, but that's something at least.

Here's another thread about the flight: <http://forums.bistudio.com/showthrea...nd-helicopters>

Real world based fantasy sports. Like mutant league hockey.

And, yes, battle zone 1 & 2 are awesome! Loved the setting, story and feeling of the first better though.

I don't recall it in DMC3. I miss Megaman.

Zelda-like games.
Apart from Darksiders, there's nothing on consoles even remotely like it - that I know of.

#14

I'd like to see a game which is a TPS with a cover system (think Uncharted/Gears) with some melee elements, but with the overarching theme of dungeons and battling bosses and finding new items in them that unlock new paths in those dungeons.
Darksiders already had handguns, but the shooting system was pretty much crap.

The concept of destructible **landscapes** which actually force you to change your plan of attack.

Destructible buildings are a great start in stuff like Red Faction and Battlefield, but it would be incredibly interesting to see landscape alterations in an AAA game and not just Worms and that Ubisoft

	(or Lucasarts?) game....Fracture? Where you had the gun that changed the height of the ground you shot.

"Frag" esque FPS games like Quake and Unreal. We just do not see these types of games anymore that are very fast, and mostly focus on 1 on 1, Deathmatch and CTF.

#29

+ Quote

I also miss the tank controls survival horror games, making you feel limited in a creepy world was a core design behind the original Silent Hill and Resident Evil games, if you wanted to dance around and kill dudes all over the place then you had ample games to play instead. These days most "survival horror" games are just action games with a horror paint job.

Pre rendered backgrounds, i loved them. For Resident Evil games it gave them weird and often deranged camera angles, you felt like you were being watched by someone at all times

For the JPRGs it gave them a great level of detail and a pretty unique look. Some just dismiss them as .jpeg put in a game, but i really loved how they were almost like paintings that the characters was walking around in.

I want games to use more Wall Running... like Ninja Gaiden or Prince of Persia. God of War III showed it in teaser trailers, but it came to the game differently. Metal Gear Revengeance has also teased it in their trailers...hopefully it makes it into the final game.

Also almost forgot...Mirrors Edge.

Parkour-style map movement in a FPS that also equally utilizes good gunplay. Basically Mirror's Edge meets Quake meets Halo.

A "Skylanders"-style approach to certain franchises could be incredibly refreshing (and rewarding for the companies). Can you imagine if Pokemon's world was completely integrated? TCG cards having AR codes for the 3DS mainline game, mainline game duos having one game on the Wii U and the other on the 3DS, and so on.

Also, give us a full-fledged item crafting mechanic in Pokemon. Minecraft meets Borderlands 2 meets Dead Space 3. We already have a shitload of potential ingredients and given the universe there's all the potential in the world to make ridiculous witch's brews whose recipes could be passed to friends and so on.

Real-time plane shifting and parallel realities.

#38

Soul Reaver (yeah I know, I'm mentioning it again) had this awesome concept that there were two parallel worlds - the living **material realm** and the dead **spectral realm**. The main character would shift from one to the other in real-time, the world distorting around him.

The material realm was all decayed architecture and faded browns and greys. The spectral realm was a distorted blue and green version of this, with pillars and walls contorting during the transition, cracks expanding to passageways, walls transforming to stairs, and outcrops turning into bridges. Rivers, lakes and all water bodies were locked into the material realm, turning a pond for example into a deep explorable spectral pit. Torrential subterranean rivers in material would become explorable caves in spectral.

In story terms, statues, murals and art from the material realm would always reveal an innate truth when viewed in the spectral realm. Murals of human warriors - who would later become vampires - showed fangs when viewed in spectral. Stained glass windows depicting a romantacised historical event in material - would creepily show the dark truth when viewed in spectral. Altars to divination, would show the demonic undercurrents beneath the religious veil.

Time also froze when entering spectral, allowing the hero to enter the realm in battle, and re-emerge in material behind his adversary.

The series neglected to explore this absolutely brilliant concept in the sequels, unfortunately. A shame as it was so expertly done, with the visible transition between the realities making the experience far more immediate than even Metroid Prime 2 and Link to the Past.

I really wish there were more games set pre-WWI. Aside from strategy games (like the total war series, paradox games), the only games I can think of that take place before then are Jordan Mechner's games and the AssCreed series. Most other games seem to think history started at 1942. #39

I mean, how awesome would be to play a game where you're a Dutch shipbuilder living in Russia during the reign of Peter the Great? Or a game where you're a noble during the French Revolution? Ugh, I want it. I have no idea what the mechanics would be, but that's such a rich setting that I don't care.

I'd love to see more fictional sports-type games too. Especially ones where each player on a team is controlled by a player.

Grifball in Halo is a good example of what I'd like to see more of. In the end it is a sort of Rugby variant, but it has enough unique concepts that it become something else. Bombing Run in Unreal Tournament is another example, though I'd rather such games didn't have shooting each other as the main interaction.

SNOWBOARDING MOTHERFUCKER

#46

SNOWBOARDING

SNOW. BOARDING. MOTHER. FUCKER.

Have I made myself clear?

Because there were not nearly enough SSX/Amped games on my 360 this gen.

--

Thief's heavily sound-focused stealth would be nice. Instead of stealth being nothing more than vision cones, unaware/aware/searching stealth states, and "don't run," I'd like to get back to Thief's use of paying attention to the surface you're walking on, listening to guards and NPCs cough and chat and sneeze, paying attention to light and shadow, and having guards who don't always immediately respond to you would be nice.

Going with Hitman's approach of "stealth doesn't have to be about keeping unseen" would be nice as well. Even Hitman: Absolution didn't really do this, with guards who'd almost instantly recognize you as out of place, or suits that would straight-up make the map a cakewalk.

Basically, I'd like stealth to have a lot more depth and versatility to it.

Originally Posted by **Kouriozan**

I'm a big fan of objective-based competitive team multiplayer. Examples would be Counterstrike, Enemy Territory, Left4Dead (in Versus), Unreal Tournament's Assault mode, etc. What I find fun about them, especially when done well, is that there's a sort of scenario design to the overall competitive match, instead of a mindless free for all kill-spam. #48

In the original Enemy Territory especially, I found it really interesting how much work was put into designing each of the maps. They have different objectives, different scenarios, and require different types of teamwork. It's pretty much like playing a single player mission with a lot of people, and with real players on the other side instead of AI. When playing with a good team who can communicate well, the experience is really amazing. It's honestly the highest form of role playing.

I wish more games explored this in their multiplayer modes, and more multiplayer games focused on actually designing each map with unique scenarios and objectives, rather than having maps built around a general purpose which can be used for DM/TDM/CTF/etc where it just becomes a scoring competition.

Standout original I.p. that creates a new gaming corridor. Barring that, I would like one experimental game that just pushes A.I. Intelligence to it's limit. Make me the uber powerful son of a gun with my super accuracy, and dozens of minions, and let 'it' survive on its wit. We need a 'Watson' moment in gaming AI. #49

Demon Souls (and obviously Dark Souls) multiplayer is something the industry needs more of. It gives you a sense of camaraderie, and sometimes the complete opposite, that other games multiplayer components simply cannot match. I'd love to see more of this.

I'd like games to focus more on enviromental interaction and mechanics, like some of the mechanics in Just Cause 2 (Grappling hook + parachute combo and what it allowed.), as well as interaction and manipulation of rope in a gameworld. #55

But any focus on mechanics would be good. 3D games haven't changed a lot mechanically since the first 3D games.

Same here. Everyone other type of surrender/fleeing I can think of is scripted. MGS put so much care into its game mechanics; MGS3, you could shoot their radios before they had a chance to call an alert, they'd slowly lower their hands if you didn't aim your gun at them, and if they got a few words out over their radio before being knocked out/killed, more guards would com eot check it out, but only on "Caution" status, I believe.

It should be in more games, even straight up action ones. I'd love to be able to rell enemies to drop their weapons or run, even if the game's a pure shooter.

I really like small things that goes beyond the game or affect the gamer himself

#57

like:

- Minigames in games(arcade machine)
- Microwave in HL
- Blue Screen Batman Arkham Asylum
- Movies from Max Payne 1 and 2

Would love to see more highly contextualized overworlds like those of Traverse: Starlight & Prairie or Ogre Battle: March of the Black Queen. Heck, even just a system that has some confounding contradictions in context would be nice (taking the city, helping the guys, getting the guys, letting the city burn, having the guys say nothing about how horrible you are - except in some cases they do).

I wish more title screens were interactive. Some games like Super Smash Bros and Killer7's title screens and other UI can be rotated with the thumbstick. I also like that you can move the camera around during cutscenes in Shadow of the Colossus. Or like playing with Mario's face in SM64.

#79

Video games should be as interactive as possible.

Originally Posted by **duckroll**

I'm a big fan of objective-based competitive team multiplayer. Examples would be Counterstrike, Enemy Territory, Left4Dead (in Versus), Unreal Tournament's Assault mode, etc. What I find fun about them, especially when done well, is that there's a sort of scenario design to the overall competitive match, instead of a mindless free for all kill-spam.

In the original Enemy Territory especially, I found it really interesting how much work was put into designing each of the maps. They have different objectives, different scenarios, and require different types of teamwork. It's pretty much like playing a single player mission with a lot of people, and with real players on the other side instead of AI. When playing with a good team who can communicate well, the experience is really amazing. It's honestly the highest form of role playing.

I wish more games explored this in their multiplayer modes, and more multiplayer games focused on actually designing each map with unique scenarios and objectives, rather than having maps built around a general purpose which can be used for DM/TDM/CTF/etc where it just becomes a scoring competition.

Oddly, the most fun I've ever had doing this was in that tacticalish Half-Life 2 mod. I can't remember the name. I think, however, people could be a lot more versatile, with Assault in UT games being the most broad, but not nearly broad enough.

The GameSpeak system, as featured in Oddworld games. A real quick and easy way to give players a wider range of interaction with NPCs.

I'd love to have a rudimentary language system like this in a GTA, for example. To use either on missions, or with random pedestrians.

Blizzard's phasing technology that they've been implementing into World of Warcraft over the last 3-4 years is amazing. The fact that you can permanently change the terrain of an environment by completing quests really gives a sense that your actions are having an effect on the world.

#90

I wish more MMO's would implement something like it, it's a great tool.

Soul Reaver (yeah I know, I'm mentioning it again) had this awesome concept that there were two parallel worlds - the living **material realm** and the dead **spectral realm**. The main character would shift from one to the other in real-time, the world distorting around him.

The material realm was all decayed architecture and faded browns and greys. The spectral realm was a distorted blue and green version of this, with pillars and walls contorting during the transition, cracks expanding to passageways, walls transforming to stairs, and outcrops turning into bridges. Rivers, lakes and all water bodies were locked into the material realm, turning a pond for example into a deep explorable spectral pit. Torrential subterranean rivers in material would become explorable caves in spectral.

In story terms, statues, murals and art from the material realm would always reveal an innate truth when viewed in the spectral realm. Murals of human warriors - who would later become vampires - showed fangs when viewed in spectral. Stained glass windows depicting a romantacised historical event in material - would creepily show the dark truth when viewed in spectral. Altars to divination, would show the demonic undercurrents beneath the religious veil.

Time also froze when entering spectral, allowing the hero to enter the realm in battle, and re-emerge in material behind his adversary.

The series neglected to explore this absolutely brilliant concept in the sequels, unfortunately. A shame as it was so expertly done, with the visible transition between the realities making the experience far more immediate than even Metroid Prime 2 and Link to the Past.

Quantum Conundrum is the game you're looking for.

Hub worlds

#93

I think it's a brilliant way to have a game be more open and the world feel connected than most linear games but without the immense time and detail that goes into a full-on open world game. Halo: ODST probably had one of the first implementations of a hub world I've seen outside of a platformer or RPG and it was wonderful. Stuff to explore and find as well as being able to see the main area shift as you finished missions was great. I want to see this in more games.

I wish more MMO's would implement something like it, it's a great tool.

Guild Wars 2's dynamic event system does this without having to jerry-rig it in with instanced phases that some players are in and some aren't. Bridges are blown up and repaired, forward bases are established and lost, enemy camps are destroyed and retaken, and everyone in the world can see it and contribute to the changes taking place.

They've even had one-time events which, despite server issues due to overwhelming response, were quite cool to see. Landing on an enemy shore, fighting off giant crabs, clearing forests to create a road into the island and using the timber to construct a permanent bridge was a blast.. and knowing nobody will ever see that happen again is kind of weird. Just wish it hadn't been so laggy because of all the people.

* **Left 4 Dead's AI director and dynamic spawning**, but applied to more interesting enemy AI than zombies. This is the main reason I'm hyped for Gears of War Judgment than any other game this year so far.

#99

* **Possessed Weaponry in Darksiders 2**. For those who don't know, you can find possessed weaponry and sacrifice other magic items to it to level it up. When a possessed weapon levels up you can choose two different magical bonuses to apply to it, based upon the properties of the items you fed it. Its a brilliant and simple crafting/item sink system for a loot game.

* **Voice control for console RTS**. EndWar showed that this could work, and work well, even if that game was mostly a tech demo. The key is not to even attempt to recreate the PC RTS experience, but re-imagine it entirely to where you aren't fighting the controls. I actually prefer voice commands over frenetic mouse clicks.

* **Syndicate's hacking**. It works just like Gears of War's active reload, but you can use it during combat to defuse grenades and missiles in mid-air, shift aspects of the environment, take control of turrets, enemies, etc. Really adds a nice dynamic to combat.

* **Need for Speed Shift's track mastery**. You're scored on each turn of a track, and when you ace all the turns you've mastered the track. This was a great mini-objective to try to conquer when practicing and provided some nice feedback and investment. Do this not only for tracks but cars as well (reach top speed for 30 seconds, drift x yards, jump x yards, win X races as stock, win X races at every class level, etc.).
